

Security and Automation

As we move further into the 21st century, home automation is an effective way to Future-Proof your home and increase your quality of life. Wireless technology can give you access to state of the art entertainment and information technology from anywhere in the home. From something as simple as a remote garage door opener, to something as advanced as a fully integrated, centrally controlled computer system, there's a FPB solution for all homes.

Access Security

Technology changes and developments are also providing new ways to control access and security for our homes. Family members will have access to keypad or keyless entry - a more convenient alternative to traditional locks - making your home a more secure and safe environment through automation.

Building a secure, Future-Proofed home doesn't have to mean building a high-tech fortress, it can be as simple as installing quality locks and deadbolts.

Alarm Systems and Home Security

Nothing does more to make your house feel like a family home than a sense of security. Simple features like security lights and monitored alarm systems are easy ways to protect your home and family. For as little as \$1 per day, you can have your home alarm monitored by an external security company.

Camera Technology

To compliment your home security system you can install a camera system which will allow you to not only see who is at the front door, but if you get called away to answer a phone you can keep an eye on the kids in the backyard or the baby sleeping by simply turning to a selected channel on the TV. You can also monitor your home from any remote internet location.

Automated Access

An automatic access system can allow you to access and view your security gates, locks and alarm system from any internet location, giving you peace of mind and reassurance of a safe and secure home, even when you're not there.

Security Fencing

Whilst traditional solid fencing has been popular in the past it does allow easy access onto your property, and once inside the fence line, intruders cannot be seen from the outside. Modular perimeter fencing keeps children and pets in, makes access for intruders more difficult and is great for pool fencing.

Home Networking

A home network offers you automated control of multiple home systems such as communication, computers, audio and video, security, electric gates and doors, air conditioning and lighting controls. Ensure you plan for future demands at the design stage of building or renovating.

Other Recommended Solutions:

- A balanced ventilation system allows for windows to be closed (security) while still supplying good indoor air quality.
- Light dimmers and lighting control systems
- Integrated active and passive heating systems working together
- Keyless security systems and access
- Monitored alarms
- Intelligent heating / air conditioning
- Integrated home theatre/audio/IT systems
